

Importing and Accessing Data

Before you can get started analyzing data, you (or the system administrator) need to configure a connection to access the data and set up an import job to import that data into Datameer.

See [Configuring a Connection](#) to learn how to set up connections. Or, ask your system administrator where the connection you should use is located. The connection contains the data you use and acts a bridge between your data and Datameer.

See [Importing Data](#) to set up an import job, or ask your system administrator which import job you should use. The import job imports data from that connection into Datameer so you can use it and create workbooks that are associated with it.

You can upload files such as CSV files, Apache Log files, or many other supported file types. See [Uploading Files](#) to learn more.

You can also link to data that is already imported. Think of a link as an alias to a connection. See [Linking to Data](#) to learn more.

Handling Imported Data

Refer to [Working with Workbooks](#) to learn how to create a workbook and manipulate your data.

See [Visualizing Data](#) to learn about the infographic widgets you can use to create charts and graphs using your data.
